15. Read the following passage and make notes. Add a suitable title. [1 x 4 = 4]

Biodiversity refers to the variability and variety of different species of plants and animals on Earth. This variety contributes towards making our planet inhabitable. The reason for the unequal distribution of various organisms in different parts of the world is varied climatic conditions.

There is greater terrestrial biodiversity near the equator and this is due to warm climate and high primary productivity. On the other hand, marine biodiversity is highest along the coasts in the Western Pacific as it has the highest sea surface temperature. Biodiversity basically clusters in hotspots and while it has been on a rise, researchers state that it is likely to slow down in the times to come. It is essential to maintain rich diversity to build a harmonious environment. It enables the survival of human beings by providing them with their basic needs such as food, shelter, medicines, etc. However, the increasing pollution which is continually degrading the environment is also having a negative impact on biodiversity. Several species that inhabited Earth earlier are now extinct and many others are feared to become extinct in the coming years. This will further lead to environmental imbalance and can prove to be hazardous for the human species

16. Make the stress for ANY EIGHT of the following words. .8 × ½ = 4

- i. examine (ii) optical (iii) solution (iv) librarian(v) specific

1 × 4 = 4

The brain has three main divisions, each having its own particular function. The cerebrum is the largest and best-developed section of the brain. It is made up of many areas containing cells that control various parts of the body. Some areas perform the function of directing muscular activity. They allow the head to be turned, for example, other areas are responsible for sight, hearing and speech. The cerebrum is also the centre of intelligence and it enables human beings to reason and remember. The cerebellum is a small section of the brain below the cerebrum its function is to coordinate the movement of limbs and also to control balance. The medulla oblongata is an enlarged area that connects the brain to the spinal cord. It serves to regulate the activities of the internal organs. It controls the beating of the heart and regulates all involuntary muscles. The parts of the brain are highly specialized. Together they make up the complex organ that controls the nervous system.
